

TAŞKIŞLA

ITU FACULTY OF ARCHITECTURE / 1850–2026 / 132 × 95 m

The character of the building — read through its outliers

POSTER 02 — THE OUTLIERS
181 SPACES · 4 METRICS
ŞEYMA OLCAY · ADC

In statistics, an outlier is what falls outside the expected range — a deviation.
In architecture, the outliers are the signature spaces — the courtyard, the long corridor, the buried workshop. Statistical anomalies reveal architectural identity.

AREA

How big is each space?

A single 2766 m² courtyard. A 636 m² studio.
Most rooms are 30–90 m². The exceptions are where the building breathes.

CONNECTIVITY

How many other spaces does each space touch?

Almost every room has exactly 1 neighbour.
A few corridors connect to 40+. They are the spine of the building.

DEPTH

How far is each space from everywhere else?

Most rooms sit 3.7 to 4.3 steps deep. The basement reaches 5.6 — archives and workshops live in the building's pockets.

INTEGRATION

Which spaces are topologically central?

The most integrated rooms are not where you'd expect. Two corridors and a quiet faculty room dominate the topology.

WHAT THE OUTLIERS REVEAL

- A single space — the courtyard — appears as an outlier across three of four metrics. It is both the biggest, the most connected, and the most central.
- The 2nd-floor corridors (#301, #320) are extreme topology outliers: each links 40+ rooms. Without them the barracks plan would fall apart.
- The basement holds the depth outliers — workshops and archives. Production-heavy programs inherit the original service-zone logic.

Outliers identified via the IQR method (1.5×IQR rule). All values computed from the 181-room dataset.
